

# Time Entry Automation

Create new time entries in your HR system from labour time captured in your work management system with job codes based on work tasks.

1 The Automation performs a **Scheduled Query** against the labor categories in your **ERP**.

2 Work orders are mapped to the **Common Message Model**.

3 New work orders and their associated time entries are created in your **ERP** or **HRIS system**. Several calculations may be required to allocate the appropriate labor time to the correct payroll categories.

4 If new labor rates or adjusting entries are identified, these are synchronized to the time entries in each work order in the **work and asset management system**.
